AR Quality Recovery After Litigation Stress

Receivables quality deteriorated sharply in 2022–2023 as geopolitical disruption extended customer payment cycles — overdue AR (>60 days) peaked at **23%** of total balance, with provision rising to €3.1M. 2024 marks a structural recovery: **57% of AR is Current**, overdue exposure fell to **8%** — below the 10% industry benchmark — and provision normalized to **€1.19M (1.7% of AR)**. Portfolio risk remains concentrated in SEG01 (Enterprise OEM, 47% of AR) — rated **A**, Net 45 terms, historically reliable.

Key insights — FY 2024

All production centers exceeded plan by ~2.1%, driving a combined overspend of €7.6M. Sales, R&D, and G&A delivered underspends of 1–2%. Net cost overrun of €5.8M (1.1%) remains within tolerance; systematic production variance warrants review of FY 2025 standard cost assumptions.

Refinancing wall — 2029

- €130M Senior Unsecured Bond matures June 2029
- Represents 51% of total debt — concentrated single event
- Refinancing required in rising rate environment
- No bridge facility currently in place

key observations

- Revolving drawn at 13% — significant headroom available
- 2027 gap year: zero refinancing obligations
- Covenant ratio 1.70x vs 3.5x threshold — comfortable
- Avg maturity 2.9 yrs reflects near-term wall concentration

Page 16 of 18 · Debt Str & Maturity Profile

TechniCon Manufacturing GmbH

● Mock data · 3M 10-K FY2025

Leverage & Coverage Ratios

2024 position: all covenants met with comfortable headroom.

Net Debt / EBITDA of 1.52x sits well below the 3.5x covenant ceiling (+1.98x headroom). Interest Coverage of 7.93x nearly doubles the 4.0x minimum floor. Debt / Equity at 0.88x and Debt / Total Capital at 47% reflect a conservatively structured balance sheet within typical Mittelstand ranges.

2022–2023 stress period: dual covenant breach.

Modelled litigation reserves compressed EBITDA from €115M (2021) to €54M (2022) and €51M (2023), pushing Net Debt / EBITDA above the 3.5x ceiling (4.50x and 4.49x respectively) and collapsing ICR below the 4.0x floor (2.18x and 1.83x). This scenario demonstrates how rapidly margin compression translates into covenant pressure — a key monitoring use case for Treasury and Controlling functions.

Recovery trajectory: swift restoration post-stress.

By 2024, EBITDA rebounded to €131M, restoring both ratios comfortably within covenant bounds. The speed of recovery underscores the importance of rolling covenant monitoring rather than annual reviews.

Portfolio project — simulated data based on anonymised industry benchmarks. Not affiliated with 3M or any real company.

Covenant Status

OK

Covenant Breach Flag

Strategy	Cost	Liquidity Impact	Recommendation
Tap revolver bridge	+120bps cost	Reduces headroom	If markets dislocated
Refi bond at maturity	+50bps spread	Neutral	Base case
Schuldschein placement	−20bps	Diversifies	If ratings stable
Equity raise	Dilutive	Strengthens	Last resort

At maximum stress (-30% EBITDA), Net Debt / EBITDA reaches 2.17x — well within the 3.5x covenant threshold. ICR remains above 4.0x under all stress scenarios including +200bps rate shock.

Conservative capital structure provides significant headroom for operational underperformance without triggering covenant breach.

Slicers & Filters

Year Filters all visuals to selected year. Single-select. Default: 2024.	Scenario ACT / BUD / FOR. Controls which dataset is shown. See Scenarios below.	Division Filters by business division. Not available on Cash Flow pages (no division split in CF data).
---	--	--

Reading the visuals

Variance colors follow standard controlling convention:

● Green — favorable variance (actual better than budget) ● Red — unfavorable variance (actual worse than budget) ● Blue — actual values (ACT) ● Amber — budget / plan values (BUD) ● Gray — prior year or forecast reference

Scenarios explained

ACT — Actual	BUD — Budget	FOR — Forecast
Real (mock) reported figures for 2020–2024.	Annual plan approved at the start of each year.	Rolling management forecast. 2025 = full-year forecast.

Known limitations

All data is fictional and generated for portfolio demonstration purposes only. Cash Flow pages do not support Division filter — CF data is company-level only.
Bridge chart sort order is fixed — dynamic reordering not supported in current visual. 2025 Forecast values are modeled estimates, not derived from a real planning process

Data model

Star schema with 5 fact tables and 4 dimension tables. All financial data is fictional, generated via Python and modeled on 3M (MMM) 10-K FY2024 ratios.

Fact tables

fact_pnl · fact_balance_sheet · fact_cashflow · fact_debt · fact_working_capital

Dimension tables

dim_calendar · dim_scenario · dim_division · dim_gl_account

Data generation

Mock data generated in Python (VS Code) with seasonality, noise, and plan-fact variance built in. Reference: 3M 10-K FY2024 — COGS ~59%, SG&A ~17%, R&D ~4.4%, operating margin ~19.6%.

Python

pandas

numpy

3M 10-K FY2024

SEC EDGAR

Seasonality model

Plan-fact variance

DAX architecture

All measures follow a 3-layer build sequence: Layer 0 (data verification) → Layer 1 (base measures) → Layer 2 (visual build). Key patterns used:

Scenario hardcoding

fact_cashflow has no relationship to dim_scenario — Scenario_ID = "ACT" hardcoded directly in CF measures.

Date_Key integer pattern

Fact tables use integer Date_Key (YYYYMMDD). Period_Year extracted via Power Query: `Number.IntegerDivide([Date_Key], 10000)`.

Stock vs. flow logic

Balance sheet and debt tables are snapshots — LASTNONBLANK / MAX(Date_Key) used, never simple SUM.

Intentional design decisions

- 2022–2023 litigation reserve modeled as anomaly period — demonstrates handling of non-recurring items in financial analysis.
- Bridge chart sort order fixed by design — DATANOMY visual limitation documented as accepted workaround.
- CF pages use hardcoded ACT scenario — architectural constraint, not data error.
- Data structures mirror SAP FI/CO master data concepts: cost centers, profit centers, GL accounts, scenarios.
